ABSTRACTED-PUB-NO: WO 9934927A

BASIC-ABSTRACT:

NOVELTY - Fractionation is carried out by classifying the waste by sieving with successively finer sieves, each fraction being then further classified by air elutriation or centrifugal separation. Ferrous components are removed by magnetic separators and nonferrous metal by centrifugal separators. Plastic components are separated by infrared spectroscopy and optical shape recognition.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for the plant to carry out the process. The main sieving stages (3, 11, 14) use sieves of 180-250 mm, 100-150 mm and 30-60 mm respectively. Air separation (4, 15, 19, 22) then produces light and heavy fractions, each being transported on a conveyor running slowly enough to avoid disturbance. Unusable residue is collected (7) for disposal.

USE - Disposal of packaging waste by separating out components which can be recycled, e.g. ferrous and nonferrous metals, plastics and paper.

ADVANTAGE - Completely automated process with minimum labor requirements giving high quality product.

DESCRIPTION OF DRAWING(S) - The drawing is a flow chart for the process.

Sack opener 2

Rotating drum sieves 3,11,14

Centrifugal or elutriating air separations 4,15,19, 22

Magnetic separators 5,9,12,18

Centrifugal metal separators 13,22

Optical or IR spectroscopy separations 6, 8, 16, 17, 20, 23, 24

Discarded waste 7

Bale press for light plastics 21
